

Ashcroft Inc. Announces New Product Test Lab Facility

A new product test center has been completed at the Ashcroft Inc. world headquarters in Stratford, Connecticut. The facility has been outfitted with a host of specialized test equipment to simulate virtually any adverse operating condition that an Ashcroft[®] product may encounter while in service.

This state-of-the-art laboratory is equipped with burst and life cycle test stations, vibration tables, extreme hot/cold temperature chambers and an environmental chamber to simulate temperature, humidity and UV conditions. Specially adapted, much of the equipment can be integrated to allow these extreme condition tests to be performed simultaneously while the products are operating under variable pressures.

In addition, the facility employs a cell to perform radio frequency and electro magnetic interference (RFI & EMI) tests on electronic instruments as well as operate and maintain master calibration standards to support the pressure calibration equipment used in the production areas.

Ashcroft Inc. engineers are using this environmentally controlled test facility to develop new products and provide expeditious, custom engineered solutions for challenging applications.

Please submit your specific application requirements and we will be happy to evaluate your special needs, provide test data and help analyze product suitability.
